

In The Management of chronic heart failure

# Eplemore 25

Eplerenone (25mg) Tablets

## INDICATIONS

- Systolic Heart Failure (Post-MI)
- Hypertension
- NYHA Class II-IV Heart Failure
- Aldosterone Excess Conditions
- Diabetic Cardiomyopathy

- Eplerenone is a selective aldosterone receptor antagonist that works by blocking aldosterone at mineralocorticoid receptors.
- It helps reduce blood pressure, prevent cardiac remodeling, and improve survival in patients with heart failure.
- Offers potassium-sparing diuretic action, minimizing the risk of hypokalemia compared to other diuretics.
- Highly selective, with fewer endocrine side effects than spironolactone.
