

Allystyle 5

Allylestrenol 5mg Tablets

The Protective touch in Pregnancy...

▶ Allylestrenol:

The drug interferes with the hormone that is responsible for the release of gonadotropin and slows down the surge of the pre-ovulatory luteinizing hormones. It is a progestin (female hormones). It works to prevent pregnancy by preventing the release of an egg from the ovary or preventing fertilization of the egg by sperm (male reproductive cells). It also may work by changing the lining of the uterus (womb) to prevent the development of a pregnancy.

Take Pregnancy to completion...
