

Information For the User
Levosulpiride 12.5mg /ml Injection

Lesutype Injection

Lesutype Injection

Dosage Form: Injection

Therapeutic Segment: Gastroprokinetic / Antipsychotic

Composition:

Each ml contains:

- Levosulpiride 12.5 mg
- Water for Injection q.s.

Description:

Levosulpiride is a substituted benzamide derivative with prokinetic and antipsychotic properties. It acts as a selective antagonist of dopamine D2 receptors, enhancing gastrointestinal motility and controlling symptoms related to functional dyspepsia, GERD, and certain psychiatric conditions.

Indications:

- Functional dyspepsia
- Gastroesophageal reflux disease (GERD)
- Irritable bowel syndrome
- Chronic gastritis
- Negative symptoms of schizophrenia
- Depression with somatic symptoms

Dosage and Administration:

- As directed by the physician
- Administered via intramuscular or slow intravenous injection

Contraindications:

- Hypersensitivity to Levosulpiride or any component of the formulation
- Pheochromocytoma
- Severe renal or hepatic impairment
- Epilepsy or history of seizures

Warnings and Precautions:

- Monitor for extrapyramidal symptoms during long-term use
- Use with caution in elderly patients
- Not recommended during pregnancy and lactation unless clearly needed

Adverse Effects:

- Somnolence, dizziness, anxiety
- Galactorrhea, gynecomastia, menstrual disorders (due to increased prolactin levels)
- Extrapyrarnidal symptoms in prolonged use

Storage:

- Store in a cool, dry place below 25°C
- Protect from light and freezing
- Keep out of reach of children

Presentation:

- 2 ml ampoule (12.5 mg/ml)

Conclusion:

Lesutype Injection offers an effective injectable option for the treatment of functional GI disorders and selected psychiatric indications where rapid onset or parenteral therapy is preferred.
