Hydroxychloroquine (200mg)

Hydroxychloroquine

- is a medication primarily used for its anti-inflammatory and immunomodulatory properties.
- It is commonly prescribed to manage autoimmune and inflammatory conditions, particularly those involving joint and skin manifestations.
- The drug works by interfering with cellular processes in the immune system, thereby reducing inflammation and preventing disease progression. Additionally, it has antimalarial activity and is used for both treatment and prophylaxis of malaria.
- Its overall usage is carefully monitored due to potential long-term side effects, particularly involving the eyes and cardiac function
